This strain sensor includes a cylindrical piezoelectric element, which is formed by laminating the piezoelectric elements. The strain sensor detects the strains in the directions of the axial and radial directions of the cylindrical piezoelectric element by applying a voltage to the outer circumferential end of the cylindrical piezoelectric element and receiving, through the outer circumferential end, a voltage generated in the inner circumferential surface of the cylindrical piezoelectric element. There has also been known a capacitive pressure sensor which includes a plurality of circular diaphragms arranged in a concentric manner. The pressure is converted into a change in electrical capacitance between a plurality of diaphragms by detecting the change in electrostatic capacitance with an AC oscillation signal and transmitting the change in capacitance. Conventional strain sensors have a problem in that their sensitivity is low. Since the piezoelectric elements are connected to a substrate by a predetermined load, their sensitivity is about 50 to 100 times lower than the sensitivity of a strain gage. Since the piezoelectric elements are short-circuited at their respective outer circumferences, it is difficult to increase the sensitivity. In a capacitive pressure sensor, a change in electrostatic capacitance is converted into a change in
